

Technologies for
people in old age
Expertise in innovative,
assistive technologies
for people in old age

Assistive technologies and robotics are becoming increasingly important at regional, national and international level with regard to everyday life in old age. In addition to our expertise, we use innovative support tools to create added value for older people and those within their wider environment: the awarding of an age innovation prize, support for start-ups and a "New Technologies – New Ways of Age(ing)?" roadshow that travels throughout Switzerland.

- Technological innovations, new health care systems and services to promote the autonomy, safety, quality of life and well-being of older people.
- Cooperation with decision makers from the fields of business, politics and industry as well as with end users.
- Ethical guidance for professionals in the fields of science, development and industry.
